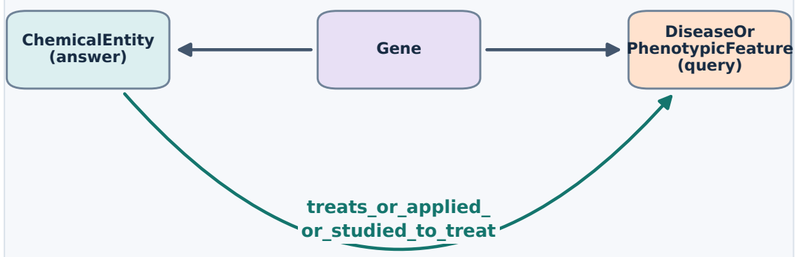
18 ARAGORN treatment rules

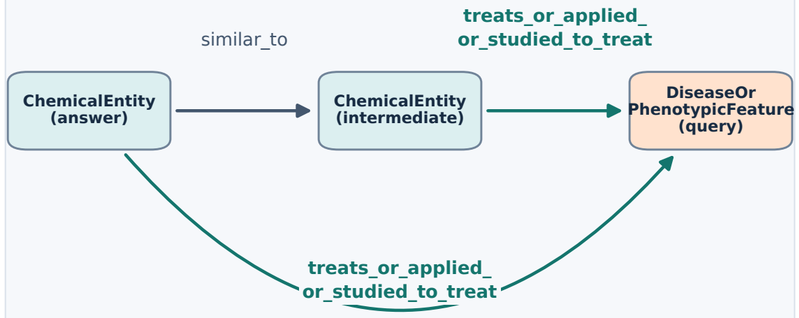
ALL edges in each panel must match. Shared conclusion: Answer chemical —treats→ Query disease / phenotype

Node types and predicates are written out; long names wrap across lines. Brackets show required edge qualifiers.

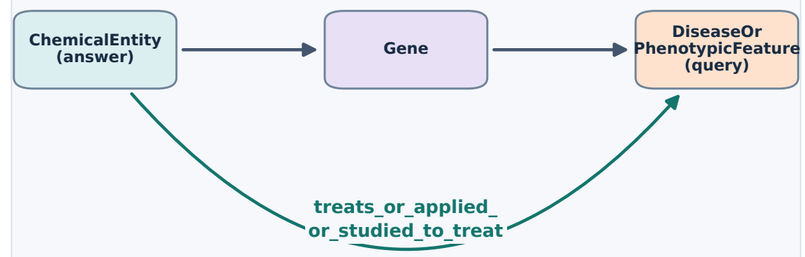
00 Gene response to chemical



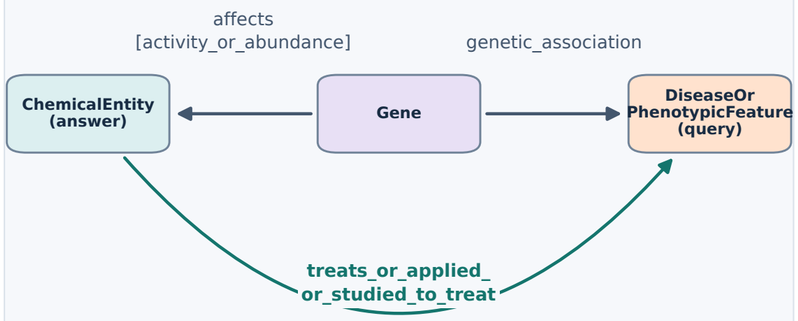
01 Chemical similarity



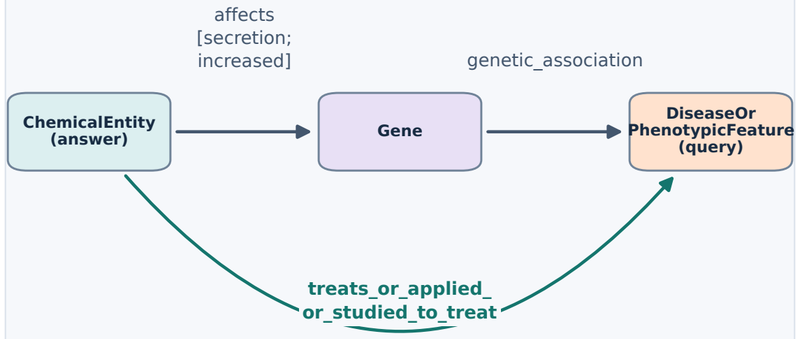
02 Chemical–gene interaction



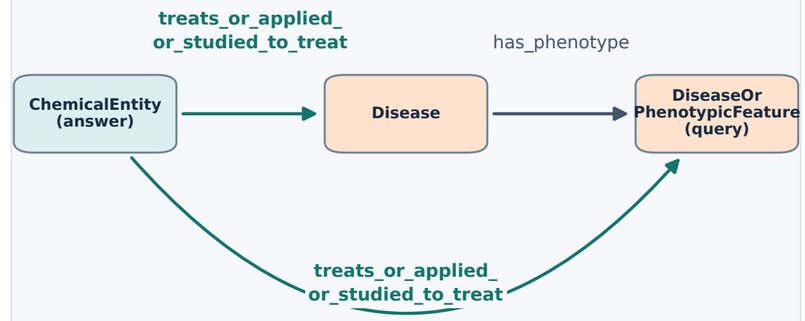
03 Gene affects chemical



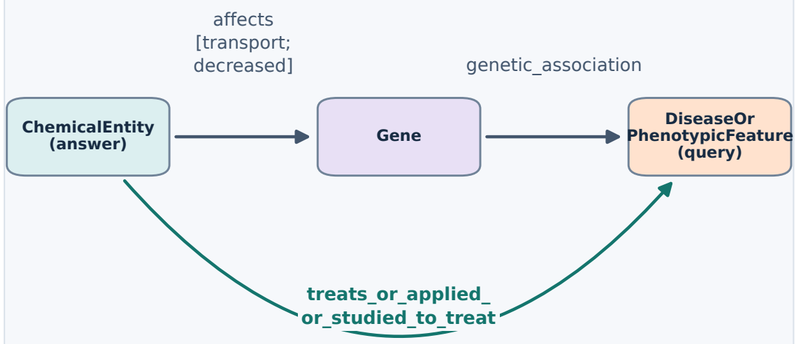
04 Increased gene secretion



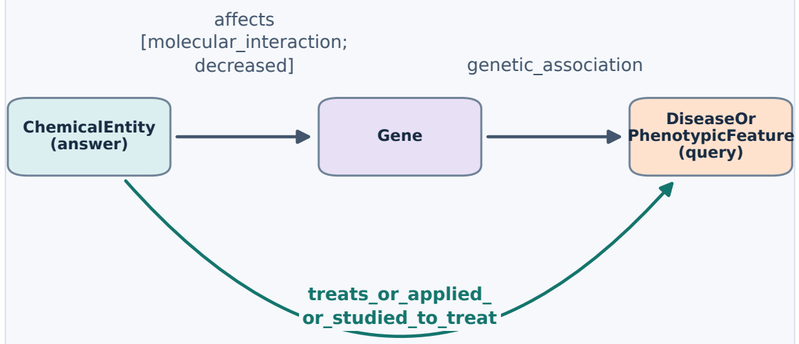
05 Treatment–phenotype triangle



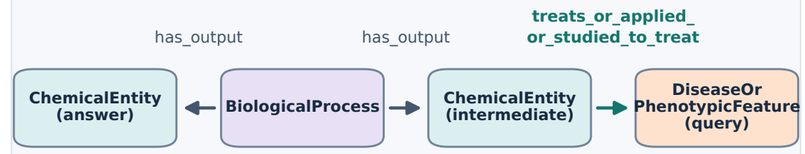
06 Decreased gene transport



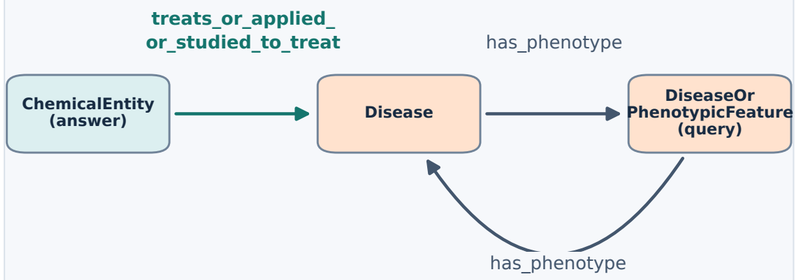
07 Decreased molecular interaction



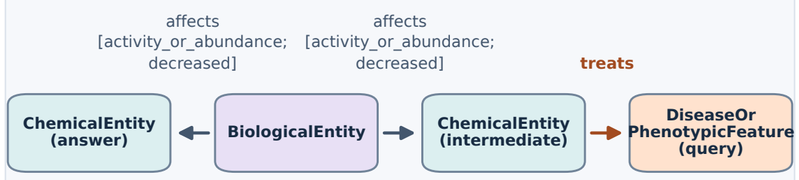
08 Shared process outputs



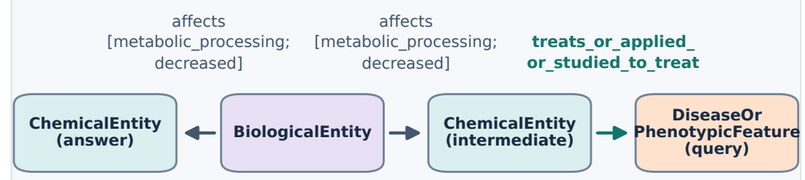
09 Reciprocal phenotype links



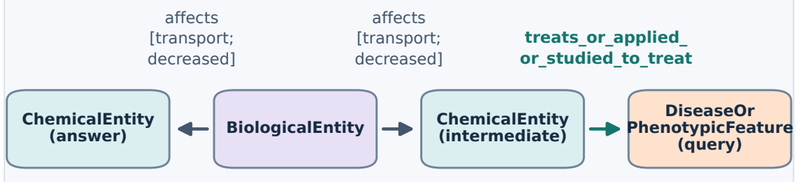
10 Shared decrease in activity / abundance



11 Shared decrease in metabolic processing

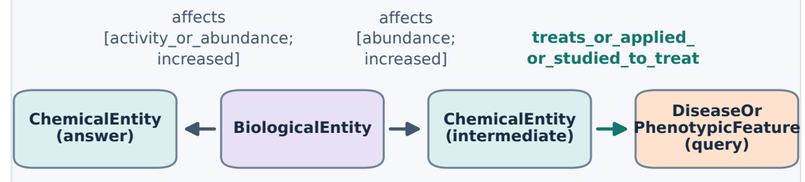


12 Shared decrease in transport

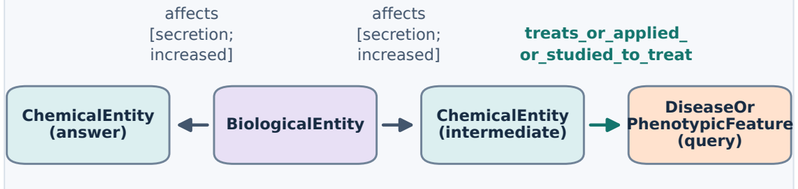


13 Correlated diseases

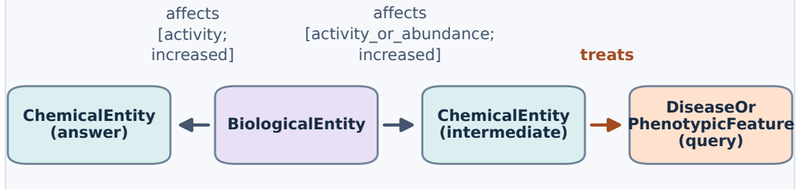
14 Abundance and activity / abundance



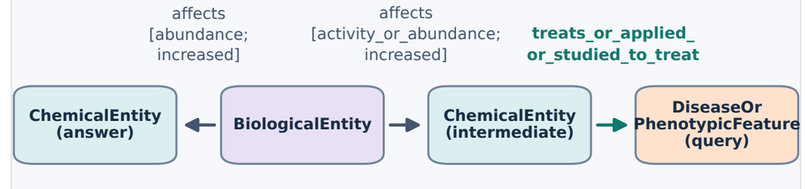
15 Shared increase in secretion



16 Activity and activity / abundance



17 Activity / abundance and abundance



IDs are zero-based (0–17). Brackets show required qualifiers. Biolink predicate and qualifier expansion applies.

Direct treatment lookup is additional and is not one of these 18 rules. Source: rules_with_types_cleaned_finalized.json
